

LUM3ND

Turn an Amazon product link into a Stellar payment intent.

MVP: real product preview + XLM quote + Freighter signature on Testnet

Amazon URL

real product data

XLM Quote

testnet asset

Wallet Sign

no real order yet

Live demo goal: prove the checkout intent loop before touching real merchant money.

Pro Hackathon 2026

The Solution

A checkout bridge, not another marketplace.

Paste a product URL, see the crypto price, sign a Stellar payment intent. The merchant does not need to integrate crypto.

UNIQUE
Works from existing
product links

LOW FRICTION
No merchant crypto
integration

SAFE MVP
Simulated fulfillment,
real Testnet proof

Clear MVP boundary: real Amazon preview + Stellar Testnet verification, not real merchant checkout yet.

PMF

Pain point: crypto stops at the exact moment people want to buy something.

A Stellar wallet can hold value, but Amazon/Trendyol checkout still expects cards or local payment rails. LUM3ND tests whether a product-first wallet flow can close that gap.

USER STORY

VALIDATION QUESTIONS

Technical Workflow

Real data in. Testnet transaction out. Fulfillment simulated after payment.

STACK

Next.js + TypeScript

Freighter, Stellar SDK, Horizon, Prisma/SQLite, Amazon preview service

GUARDRAILS

No private keys, no card data, no real Amazon order.

MVP only verifies product context, XLM quote, wallet signature and transaction proof.

Next technical jump: USDC/mainnet receiver + operator fulfillment records + refund verification.

The Team

A. Hakan Demir - Solo Builder

Full-stack developer building the product, API, Stellar flow and live demo narrative.

PRODUCT

Demo flow, UX, pitch story

ENGINEERING

Next.js, API, pricing, validation

STELLAR

Freighter, Testnet, transaction proof

NEXT 2 WEEKS

1. Polish

demo UX

2. USDC

mainnet path

3. Pilot

operator flow

4. Refunds

compliance-ready records

Ask: feedback, Stellar ecosystem guidance, and a path from testnet intent to compliant fulfillment.
